ABSTRACT

OCEANUS cruises 141 (28 October-4 November 1983) and 145 (22-29 January 1984) were the tenth and eleventh cruises to the Long Term Upper Ocean Study (LOTUS) area centered at 34°N, 70°W. During OCEANUS 141, a C. S. Draper Labs profiling current meter (PCM) was set, the fifth LOTUS surface mooring was recovered, and the deployment of the sixth LOTUS surface mooring was unsuccessfully attempted. The sixth surface mooring was finally deployed in January, on OCEANUS 145. This report provides details of the work accomplished on both cruises, as well as presenting the hydrographic data collected.

ACKNOWLEDGEMENTS

The LOTUS moorings set and recovered during OCEANUS cruises 141 and 145 were designed and prepared and handled at sea by the WHOI Buoy Group, composed of personnel from the Physical Oceanography Department and the Ocean Structures and Moorings Section of the Ocean Engineering Department.

We are grateful for the skill of Captain Paul Howland and the personnel of the R/V OCEANUS. We thank Richard Trask for his help on this report.

This work was supported by the Office of Naval Research under Contract No. N00014-76-C-0197, NR 083-400, and N00014-84-C-0134, NR 083-400.

Introduction

The main purpose of OCEANUS cruises 141 (Leg 1) and 145 was to replace the Long Term Upper Ocean Study (LOTUS) surface mooring located in the vicinity of 34°N , 70°W , as a continuation of the two year long LOTUS field program (Briscoe and Weller, 1984). Adverse weather conditions on Leg 1 of OCEANUS 141 contributed to damage of the surface mooring discus buoy and meteorological sensors, and the Waverider buoy during deployment. The gear was brought back to Woods Hole, repaired, and subsequently deployed on OCEANUS 145.

Figure 1 shows the LOTUS area (33° – 35°N , 69° – 71°W) relative to the Gulf Stream, the east coast of the United States and Bermuda. The site is in the mid-ocean away from the direct influences of topography and the Gulf Stream, in the path of hurricanes and Gulf Stream rings and at the edge of the region of eighteen degree water formation and high eddy kinetic energy.

The deployment of the moored array during OCEANUS 141 was to have been the fourth and final science deployment planned for the LOTUS experiment. OCEANUS 145 became the actual final science deployment of the LOTUS project. The first science deployment, designated LOTUS-3, occurred in May 1982 and consisted of a surface mooring, a near-surface mooring and two subsurface moorings. Details of that deployment can be found in Trask and Briscoe (1983a). The LOTUS surface mooring is replaced every six months whereas the near-surface and subsurface moorings are replaced once a year. In October–November 1982 the surface mooring deployed in May was replaced by a nearly identical surface mooring which was designated as LOTUS-4 (Trask and Briscoe, 1983b). In May 1983 the entire moored array was replaced (Trask and Briscoe, 1983c). In early November 1983, the surface mooring, LOTUS-5, was scheduled to be replaced with LOTUS-6. Due to the aforementioned damage to the discus buoy, LOTUS-5 was recovered on OCEANUS 141, but the new surface mooring (LOTUS-6) was not deployed until January 1984, on OCEANUS 145.

This data report summarizes the mooring work, CTD and XBT stations conducted on OCEANUS cruises 141 and 145. The two cruises are here presented together. The format of this report gives a general overview of the work of the two cruises, and presents the hydrographic data separately for each cruise. Thus, the report has three sections: one including information pertaining to both cruises; the second containing all the hydrographic data from Leg 1 of

OCEANUS 141 and the XBT data from Leg 2; and the third with all the hydrographic data from OCEANUS 145.

Table I gives the nominal contents and publication dates of the entire LOTUS report series.

Navigation

During OCEANUS 141 and 145 two systems of navigation, both based on LORAN C, were utilized. Positions from the more conventional system which has been used during previous LOTUS cruises are based on the geographical calculation performed by the Northstar 7000 LORAN-C unit. The second system uses only the time delays from the Northstar 7000 unit. A position is determined by an independent geographical calculation which makes use of a knowledge of the additional secondary phase factors for the LOTUS area and the transit region. The calculation is performed by a Hewlett-Packard 85 desk top computer, thus the second system has been termed NAV85. A small program error was found in the system on OCEANUS 141, and corrected in time for use on OCEANUS 145; the error gave NAV85 position offsets if the ship was steaming full-ahead. The system functioned properly on the latter cruise, but no detailed study has been made of the accuracy of the system. Therefore the NAV85 continues to be in the development stage. All positions shown in this report are based on the geographical calculation performed by the Northstar 7000 LORAN-C unit.

The Northstar algorithm provides a geographical position that is south-east of the true (satellite based) position. From numerous simultaneous position fixes in the LOTUS area we have determined an average offset of the LORAN-based calculation. Table 2 shows the offsets and standard deviations for the Northstar 7000. Positions listed in Tables and Figures in this report are all the Northstar 7000 positions; to convert to absolute geographical positions the offsets shown for the Northstar 7000 in Table 2 should be added.

Table 2. Offsets (and standard deviations) from LORAN position to geographical position, based on simultaneous LORAN and satellite position fixes (GEOG = LORAN + OFFSET).

UNIT	OFFSET (S.D.)		OFFSET (S.D.)	
	North	West	Range [km] *	Bearing
Northstar 7000	1.07' (.15)	1.24' (.16)	2.76' (.32)	316° (4)

* 1 km = .54 nautical miles.

Cruise Summary

OCEANUS 141

October-November 1983

Leg 1 of R/V OCEANUS Cruise 141 was the tenth scheduled cruise to the LOTUS area, centered at 34°N, 70°W. The cruise was eight days long, ending in St. Georges, Bermuda.

The LOTUS surface mooring, designated "LOTUS-5" (mooring number 787) was recovered during the cruise. Subsequently, the deployment of the surface mooring to replace LOTUS-5 was attempted. Unfortunately, a quick release hook malfunctioned, dropping the discus buoy during deployment, and damaging the tower and meteorological sensors significantly enough to warrant canceling the deployment. The redeployment of the surface mooring was planned for January 1984 (see cruise summary for OCEANUS 145).

Since the new surface mooring (mooring number 791) was not deployed, a trial of the internally recording and telemetering Datawell Waverider buoy, which was to have been tethered to 791, was planned. While the Waverider was tethered to the ship, a squall pushed the ship over the tether line, and fouled the tether in the ship's propeller. Approximately eight hours later the Waverider was sighted and recovered, revealing that the encounter had broken its radio antenna and light, and done structural damage to the sphere itself. The Waverider was replaced in time for re-deployment with the new surface mooring in January.

Other mooring work completed in the LOTUS area on OCEANUS 141 (Leg 1) involved the setting of a C.S. Draper Labs profiling current meter (PCM) mooring, in cooperation with C. Eriksen of MIT. Mooring work outside the LOTUS area consisted of the recovery of a surface mooring in the Gulf Stream (37°36.94'N, 68°00.07'W) for H. Bryden's Gulf Stream Observation (GUSTO) project.

Non-mooring work on this cruise consisted of calibration trials of the Acoustic Profiling of Ocean Currents (APOC) system, which was run nearly continuously on Legs 1 and 2.

XBT sections were made during Legs 1 and 2 of this cruise. Both sections are presented in this data report, although no other information from Leg 2 is included, because the XBT data was collected for this project on an otherwise unrelated trip. As well, three CTD stations were completed on Leg 1 of OCEANUS 141; details of the XBT and CTD work are presented in Part II of this report. A chronological log of OCEANUS 141 along with a plot of the cruise track appear in Appendix 1.

Cruise Summary

OCEANUS 145

January 1984

Cruise number 145 of the R/V OCEANUS was the eleventh cruise to the LOTUS area (34°N, 70°W). The cruise departed Woods Hole on 22 January, and returned seven days later on 29 January.

During this cruise, a new surface mooring (mooring number 792) was successfully deployed. This mooring is designated LOTUS-6. The Datawell internally recording and telemetering Waverider buoy was also successfully deployed, with its tether attached to the discus buoy of 792. The output of the Waverider was monitored from the ship, with observations made regarding corresponding sea state and wind speeds. Other mooring work in the LOTUS area consisted of doing acoustic surveys of the newly set surface mooring (792), the subsurface mooring (788), and the east (789) and south (790) intermediate moorings.

The location of each of the moorings and the C.S. Draper Labs/MIT Profiling Current Meter (PCM), following OCEANUS 145, are shown in Figure 2. Mooring diagrams, including LOTUS-5 (787, recovered November 1983) and LOTUS-6 (792, deployed January 1984), are shown in Figure 3. The instrument depths shown in Figure 3 are design depths; actual depths may vary slightly. Table 3 summarizes the mooring deployment times and positions.

Non-mooring work in the LOTUS area involved the following; doing several tests of the Weller-Dean Real Time Profiler (RTP); performing two anchor drag trials, to determine the horizontal force required to move a mooring's anchor; and attempting (unsuccessfully) to take cores of the bottom material in the LOTUS area.

An XBT section was made on the trip south, and nine CTD casts were made in the LOTUS area. Details of the XBT and CTD work from this cruise are presented in section III of this report. A chronological log of OCEANUS 145, along with a plot of the cruise track appear in Appendix II.

CTD Data Format and Presentation

The following is a brief discussion of calibration and preliminary processing procedures used in our CTD work.

Data Presentation

The CTD/IR data are presented in two forms, tabular listings and graphical profiles. The profiles are reproductions of the original computer plots. Included here are profiles of potential temperature, salinity, Brunt Väisälä frequency, and potential density referenced to the surface (Figures 5-9). Full depth profiles as well as profiles of the upper 750 meters are presented. In addition a potential temperature-salinity diagram is presented for each station. The listings of data (Tables 5-9) include the above parameters plus sigma-t, potential temperature gradient, dynamic height, and sound speed, all at standard pressures as well as at the design depths of the instrumentation on the moorings.

The heading of the tabular listing includes the ship name (OC = OCEANUS) and cruise number, CTD number, year, year day, time, the latitude and longitude (LORAN-7000 position) of the CTD station when it started and the water depth at that station. Abbreviations used in the listings include PRESS for pressure, TEMP for temperature, SALIN for salinity, PTEMP for potential temperature, POTGRD for potential temperature gradient, POTDEN for potential density, BR-V for Brunt Väisälä frequency, SSPEED for sound speed and DYNHGT for dynamic height.

Summary of Calibration and Data Processing Procedures

The CTD/IR routinely undergoes pre-cruise laboratory calibrations at WHOI. The laboratory calibration of the temperature and pressure sensors is relied on totally for adjusting the calibration coefficients of those sensors. The conductivity sensor is calibrated using water samples collected at the bottom of each cast. Based on a comparison of the water sample salinities and the CTD/IR conductivity readings a conductivity cell factor is computed for

each station. The cell factor is the scaling factor by which the measured conductivity must be multiplied to obtain the "true" conductivity. The conductivity values of the entire cast are then multiplied by the appropriate cell factor to obtain the "true" conductivities.

The preliminary CTD/IR data processing is accomplished with a SEA DATA 12A cassette reader and Asynchronous Reader Interface in conjunction with a Hewlett Packard (HP) 85 desk top computer and HP 5.25 inch flexible disc drive, printer and 7225B plotter. The preliminary processing takes the raw down cast data from cassette and applies the appropriate calibration coefficients, edits wild points, applies a pressure and conductivity sensor time lag correction, pressure averages the data (2 dbar pressure range) and stores the data on flexible disc.

All salinity computations are based on the 1978 Practical Salinity Scale (Lewis and Perkin, 1981) as recommended by the Joint Panel on Oceanographic Tables and Standards. Further processing incorporates the new equation of state for sea water (Millero, et al., 1980) for computing density and its related parameters such as specific volume and specific volume anomaly. Potential temperature at a reference pressure is computed using a fourth order Runge Kutta integration algorithm (Fofonoff, 1977) which uses the Bryden (1973) polynomial for adiabatic lapse rate. Sound speed calculations are based on the algorithms of Chen and Millero (1977). These algorithms are the basis of further computations which yield quantities of sigma-t, sigma-theta, dynamic height, potential temperature gradients and Brunt-Väisälä frequency. The Brunt-Väisälä frequency calculation incorporates a sliding least squares fit to the potential density data over user specified smoothing windows. Four windows were chosen for this calculation. A smoothing interval of 10 dbars was used between 0 and 150 dbars, a 30 dbar interval between 150 and 1500 dbars, 62 dbar interval between 1500 and 3500 dbars and a 90 dbar smoothing interval between 3500 dbars and the bottom.

PART II

Hydrographic Data

OCEANUS 141

28 October - 10 November 1983

Table 1: Summary of the USFV work conducted on OCEANUS 141

Station	Date (GMT)	Lat (N)	Long (W)	Depth (m)	Water Temp (°C)	Surface Salinity (PSU)	Bottom Type
1	28 Oct 83 (1983)	17°37' N	158°02' W	4130	14.5	35.2	S
2	29 Oct 83 (1983)	17°42' N	158°01' W	4017	14.5	35.2	S
3	29 Oct 83 (1983)	17°42' N	158°01' W	4113	14.5	35.2	S

A. CTD Data: OC 141

During OCEANUS 141, three CTD stations were made, one at the Gulf Stream Observation (GUSTO) project site, and two in the LOTUS area (Figure 4). The measurements were made by a Neil Brown Instrument Systems internal recording conductivity-temperature-depth profiler (CTD/IR); mechanical and operational details of the LOTUS CTD/IR are found in Trask (1981).

The first station was performed at the GUSTO site (37°36.96'N, 68°00.08'W) immediately prior to the recovery of the mooring. This cast was terminated at 1400 m. Stations 2 and 3 were both in the LOTUS area, and each went to a depth of approximately 5000 m. The second station was done near the south intermediate mooring, and the third near the LOTUS-5 surface mooring location. The positions of these three CTD's are shown in Table 4.

Table 4: A summary of the CTD/IR work conducted on OCEANUS cruise 141.

CTD Station	Date (year day)	Start Time (UTC)	Deployed Position		Pressure Range (dbar)
			Lat. (N)	Long. (W)	
1	29 Oct 83 (303)	1429	37°37.88'	68°02.35'	0-2919

Figure 7. Two station 7. Profiles of potential density (σ_t) and salinity (a), and potential temperature (θ) and potential density (σ_t) for the upper 150 m (a and c respectively) and for the entire cast (b and d respectively). 7-2 diagram included in c.

B. XBT Data

Expendable bathythermograph data were collected approximately hourly (approximately every 20 km) along 70°W between 39°N and 34°N during the trip to the LOTUS area.

A Bathysystems digital logger stores the XBT casts at 1/10 second intervals (approximately every 60 cm) for later analysis. Using a Sea Data 12A reader with an ARI (asynchronous interface) to an HP85A, we transcribe, edit, annotate, smooth, and store the data in 2 dbar intervals on flexible discs.

The depths of the whole degree isotherms were transcribed from the strip chart records and plotted. Figure 8 is a chart showing the location of individual XBTs taken during the trip south. Figure 9 shows the XBT section from the southbound trip. Also, the locations of XBT's taken on the northbound trip from Bermuda to Woods Hole (Leg 2) are shown in Figure 10. Figure 11 shows the XBT section from this leg. Vertical exaggeration of the XBT sections is 1:463. Figure 12 is an overplot of all the XBTs made in the LOTUS area during OCEANUS cruise 141 (numbers 1-83). This presentation shows the range of temperatures observed due to the combined effects of the temporal and spatial variations.

All LOTUS XBT traces are supplied to the National Oceanographic Data Center for general access and usage.

AT CTD Data: 00 145

Nine CTD stations were made in the LOTS area (Figure 13) during OCTOBER 1984. The CTD measurements were made by a Ball-Bow Instrument Systems Inter- and recording conductivity-temperature-depth profiler (CTD/IR) (mechanical) and operational details of the LOTS CTD are found in Table 1 (1984).

Station 1 was made near the newly deployed LOTS-5 surface mooring (1984). The CTD was retrieved at approximately 4000 m, because the ship was drifting towards the mooring. Hydrographic Data

OCEANUS 145

22-29 January 1984

Station 2 was made near the east (1984) and south (1984) subsurface moorings. Station 3 was of a series of shallow to deep (several down-up profiles) between the surface and 400 m, near the PCM and LOTS-5. Station 4 and 5 were completed east and north, respectively, of the LOTS surface mooring. Station 6 was made near the LOTS surface mooring from the surface mooring. Summary of the CTD/IR stations taken during OCT 1984 appears in Table 1.

Table 1: A summary of the CTD/IR work conducted on OCEANUS cruise 145.

Station	Date (year day)	Start Time (UTC)	Depth (m)	Latitude (N)	Longitude (W)	Pressure (dbar)

A. CTD Data: OC 145

Nine CTD stations were made in the LOTUS area (Figure 13) during OCEANUS 145. The CTD measurements were made by a Neil Brown Instrument Systems internal recording conductivity-temperature-depth profiler (CTD/IR); mechanical and operational details of the LOTUS CTD/IR are found in Trask (1981).

Station 1 was made near the newly deployed LOTUS-6 surface mooring (792). The CTD cast was terminated at approximately 4000 m, because the ship was drifting towards the mooring. Stations 2, 3, and 4 were shallow casts done near the profiling current meter (PCM) during the time period at which it records, thus providing a check on the calibration of the PCM. Stations 5 and 6 were done near the east (789) and south (790) subsurface moorings, respectively. Station 7 was of a series of shallow yo-yos (several down-up profiles) between the surface and 400 m, near the PCM and LOTUS-6. Stations 8 and 9 were completed east and north, respectively, of the LOTUS surface mooring, approximately equidistant with the subsurface moorings from the surface mooring. A summary of the CTD/IR stations taken during OC 145 appears in Table 8.

Table 8: A summary of the CTD/IR work conducted on OCEANUS cruise 145.

CTD Station	Date (year day)	Start Time (UTC)	Deployed Position		Pressure Range (dbar)

B. XBT Data

Expendable bathythermograph data were collected hourly (approximately every 20 km) along 70°W between 40°N and 34°N during the trip to the LOTUS area.

A Bathysystems digital logger stores the XBT casts at 1/10 second intervals (approximately every 60 cm) for later analysis. Using a Sea Data 12A reader with an ARI (asynchronous interface) to an HP85A, we transcribe, edit, annotate, smooth, and store the data in 2 dbar intervals on flexible discs.

The depths of the whole degree isotherms were transcribed from the strip chart records and plotted. Figure 21 is a chart showing the location of individual XBTs taken during the trip south. Figure 22 shows the XBT section from the southbound trip. Vertical exaggeration of the XBT sections is 1:463. Figure 23 is an overplot of all the XBTs made in the LOTUS area during OCEANUS cruise 145 (numbers 1-30). This presentation shows the range of temperatures observed due to the combined effects of the temporal and spatial variations.

All LOTUS XBT traces are supplied to the National Oceanographic Data Center for general access and usage.

Figure 21. Chart showing the location of individual XBTs taken during the trip south to the LOTUS area.

APPENDIX I

CHRONOLOGICAL SUMMARY

OCEANUS 141 (LEG 1)

28 October-4 November 1983

28 October - Day 301

- 1950Z : Leaving dock at Woods Hole. Winds 20-30 knots and forecast to increase.
- 2000Z : Weather awful. Science meeting to discuss options if it should prove impossible to work at the Gulf Stream site.

29 October - Day 302

- 0200Z : Not making much headway. After discussion with Captain we decide to press on however slowly and make our way down to the Gulf Stream site. Will probably lose a full day out of our program.
- 1200Z : Wind has dropped a little; now making 8 knots. Should arrive at the Gulf Stream site about 22 hours after planned time.
- 1515Z : First XBT on section toward GUSTO site.
- 1800Z : APOC calibration under way; XBT series suspended during calibration. Will attempt to increase frequency of XBT's as the shelf-break front is approached.
- 2045Z : APOC calibration run completed. XBT series to start again at 2100Z with No. 5.
- 2216Z : Gulf Stream north wall location received from NMN; plotted position shows us about 6 hours from it.

30 October - Day 303

- 0425Z : GDR paper not feeding properly.
- 0507Z : GDR up and running, also new paper installed.
- 0945Z : Beginning bathymetry line over Gulf Stream mooring site.
- 1211Z : Bathymetry line completed; back over site and putting hydrophone in.
- 1216Z : Timed pinger enabled.

1220Z : Range to mooring 4604 uncorrected meters. Corrected slant range about 4696 m, the water depth is 4688 m, the transducer depth is 5 m, and the release is 30 m off the bottom. This gives 631 m horizontal range.

1230Z : Move to begin the acoustic survey.

1250Z : Eastern point is 5218 m uncorrected slant range, 2818 m horizontal range.

1315Z : 6575 uncorrected or 5033 m horizontal range. This completes the survey with all crossings in the vicinity of 33°37.8'N and 68°02.7'W.

1355Z : 3693 m horizontal ranges; checks OK.

1410Z : Will do the first CTD station here, about 2 miles NW of the mooring.

1435Z : CTD #1 under way at GUSTO site. The deck is being rigged at the same time for the mooring recovery, including the removal of the bulwark on the starboard quarter.

1529Z : Messenger has switched ping-rate to double on CTD; rehaul commenced.

1638Z : CTD on board and secured inside; water samples taken. Move to anchor position to commence recovery.

1740Z : Good transpond at 4475 m uncorrected, or 340 m horizontal range.

1745Z : Timed pinger responds.

1751Z : Release command sent. Pinger responds.

1754Z : Top ball on surface, with working light but no radio, about a quarter mile north of us.

1838Z : Bottom ball cluster on surface.

1855Z : Top ball on deck and secured; first instrument aboard.

2018Z : Best-guess GUSTO position was 37°36.94'N, 68°00.07'W.

2058Z : Release onboard, mooring recovery complete.

2120Z : Head south to begin bathymetric survey.

2133Z : Turning to 070T (made good) to get the depth along the mooring's isobath.

2155Z : Turning back along the reciprocal course to get a long bathymetric line through the mooring site.

2300Z : Recommence XBT section on the way to Site L; XBT No. 27.

31 October - Day 304

1308Z : Dumping GUSTO wire from Pengo during transit to Site L.

1327Z : Wire dump complete.

1600Z : Last XBT (No. 47), 6 miles from Site L.

1706Z : Alongside LOTUS-5 and drifting; LORAN 7000 shows 250-260°T at 0.5-0.7 kts.

1728Z : Difficulties hearing 787 (LOTUS-5) release.

1754Z : Spare GDR installed and working better than old one; can hear transponder but not timed pinger.

1847Z : AMF 205 gives 5332 m slant range, or 1590 m = 0.86 n.mi. horizontal range.

1849Z : Release command sent.

1851Z : Release confirmation heard.

1955Z : Balls sighted; commence maneuvers for pickup.

2127Z : Eppley pyranometer glass hemisphere on LOTUS-6 broken by fish gaff while crew fishing during LOTUS-5 recovery. Spoke with Joe Poirier at WHOI on SSB (arranged by ham contact through phone patch from Maryland) to see about replacing it with the Eppley from LOTUS-5.

1 November - Day 305

0158Z : LOTUS-5 aboard and secured.

0300Z (approx) Zani and Briscoe switch Eppley pyranometer from LOTUS-5 to LOTUS-6.

0400Z (approx) Wire-test acoustic release for LOTUS-6.

0800Z (approx) Move to mooring 789 (East Intermediate) for acoustic survey.

0934Z : Commence acoustic survey of 789.

1150Z : Survey complete. Move to mooring 790 (South Intermediate).

1312Z : Finishing dumping wire from LOTUS-5.

1334Z : Commence acoustic survey of 790.

1529Z : Survey complete.

1620Z : CTD No. 2 begun at 790 site.

1926Z : CTD station complete.

2007Z : Move to LOTUS-6 launch point.

2113Z : New tape in Sea Data 1736 logger: 0.5 second sampling, 2048 samples 2^h burst interval.

2158Z : Waverider buoy in water.

2252Z : Quick-release hook opened on LOTUS-6, dropping buoy to deck and damaging tower and meteorological instruments. LOTUS-6 launch aborted; Waverider recovered.

2313Z : Discussing options with Science party:

- (1) Redeploy LOTUS-5 buoy with
 - (a) LOTUS-5 meteorological sensors
 - (b) LOTUS-6 sensors
- (2) Move LOTUS-5 tower to LOTUS-6 buoy
- (3) Abort deployment entirely.

2 November - Day 306

0130Z : Deployment aborted: will wait until December or January to redeploy. Bring all gear back in lab and prepare for other work.

0315Z : Commence APOC calibration run.

0824Z : Calibration run completed. Return to 34°N, 70°W.

1318Z : Are in process of (a) preparing for a CTD station, (b) off-loading LOTUS-6 wire and nylon from the Pengo winch, (c) winding the PCM mooring onto the winch, (d) moving glass balls, and (e) repairing the crane wire (which jumped the drum during last night's problem).

Also, Gregory-Allen pointed out a NAV85 problem: either a smoothing algorithm or iteration/convergence problem means we do not get to the same geographical position from successive inputs of the same time-differences.

Will try and redeploy the Waverider during the APOC time-series later on, to give the wave field as originally planned.

1333Z : Commence CTD#3 at Site L.

1650Z : CTD #3 completed.

1708Z : Determining ship set/drift to choose PCM launch start position. The target is 34°00.71, 70°03.46.

1945Z : At start position for PCM. Set/drift is 315T @ 0.6 kts; wind approximately 045T @ 10-15. Will start from 33°50.61, 70°11.34, and steam 045T @ 1.6 thru water, or 033T @ 2.0 made good.

2000Z : PCM in water.

2300Z : Towing PCM to anchor point.

3 November - Day 307

0108Z : Will allow about 6% fallback, i.e. 305 m.

0113Z : Anchor in.

0151Z : Anchor on bottom.

0222Z : Commence acoustic survey of PCM anchor.

0345Z : Survey completed.

0412Z : Waverider in water on tether off port quarter. Putting CTD in water off block on starboard boom of the stern frame for a tow-yo series during the APOC time series.

0440Z : Waverider lost as a sudden squall drives ship down over tether. Radio signal apparently weak but still present. Commence search for buoy.

1043Z : Bridge reports visual sighting.

1053Z : Smashed Waverider floating at 33°58.73, 70°01.48.

1105Z : Buoy on board; obvious encounter with ship's propeller removed light and radio antenna. Apparently the signal we were tracking all night was not the Waverider.

1225Z : Underway to 789 (East) mooring for CTD station.

1300Z : Bridge requests cancellation of CTD station and direct transit to Bermuda; sound indicates something is either wrapped around the screw or there is a strut loose. If repairs in Bermuda are necessary we will need the time, and passage there cannot be at usual speed.

4 November - Day 308

1720Z : Dockside St. Georges, Bermuda, end of OCEANUS Cruise 141, Leg 1.

Figure A-1. Cruise track of OCEANUS cruise number 141.

APPENDIX II
CHRONOLOGICAL SUMMARY

OCEANUS CRUISE 145

22-29 January 1984

22 January - Day 022

- 1815Z : Leave dock at Woods Hole, bound for 34°N, 70°W via 40°N, 70°W.
1900Z : Science meeting in library.

23 January - Day 023

- 0400Z : XBT #2, first on 70°W section. (XBT #1 was a test at dock.)
1600Z : High Seas Forecast (NMN/8765.4 kHz USB) suggests good weather at Site L for at least through Thursday (Day 026).
2100Z : Fire and boat drill.

24 January - Day 024

- 1110Z : At Site L; will check set and drift.
1147Z : Commence wire test of acoustic releases.
1200Z : Drifting 313T at 0.8 knots; wind 10-20 knots from 112T.
1308Z : Enabled release on mooring 788 and got slant range of 8.07 km, or 3.3 n.mi. horizontal range. Chart shows us about 3.5 n.mi. from mooring.
1430Z : Started 1736 Wavelogger; first record will be at 1500Z. Set for 0.5 second sampling, 2048 samples, every 30 minutes. The strip chart is set for 10 minutes every 2 hours (even-numbered, Zulu), but the pen is almost dry.
1445Z : Decision to deploy Waverider. One of the tethers was tangled, so will deploy just one rubber/wire-rope combination, with a wire-rope shot on either side.
1451Z : Waverider in water trailing aft.
1521Z : Top instruments on LOTUS-6 are over the side.
1527Z : Speed increased to 1.5 kts thru water to help swing the buoy astern. P. Clay has installed the quick-release hook and checked it twice.

1533Z : LOTUS-6 in water, quick-release pulled. Perfect launch. The Waverider tether actually helped by keeping the buoy oriented alongship.

2010Z : Last shots of nylon; glass balls next. Making 1.8-1.9 kts thru water. 0.9 over bottom. Target 1.1 n.mi. away. Will assume 12% fallback, i.e. 0.35 n.mi.

2133Z : Anchor in. Buoy range 2.64 n.mi. at 315T.

2150Z : Close by buoy; Waverider riding well with rubber cord only slightly stretched.

2227Z : Begin survey of LOTUS-6 [mooring number 792] and 788 position.

25 January - Day 025

0050Z : Complete acoustic survey. Return to LOTUS-6 for CTD station.

0126Z : Commence CTD station No. 1 at LOTUS-6.

0250Z : Stopped lowering CTD; ship has drifted between surface buoy and anchor. Slow rehaul.

0408Z : CTD aboard without incident.

0542Z : CTD No. 2 commenced about 2 miles NW of PCM anchor position. Going down to 200 m.

0630Z : Finish CTD No. 2, moving 5 miles due south.

0730Z : CTD No. 3 to 250 m.

0755Z : CTD No. 3 completed.

0758Z : CTD crew assaulted by rogue wave.

0832Z : CTD No. 4 to 250 m.

0845Z : CTD No. 4 completed.

0915Z : Started to collect water samples for Celia Chen at URI.

1005Z : Water sampling complete.

1210Z : Alongside LOTUS-6.

1215Z : Waverider yawing $\pm 25^\circ$ at the end of its tether.

1438Z : Commence anchor drag tests.

1459Z : Abort drag test; tensiometer not functioning correctly.

1609Z : Test releases on 789; some confusion on when timed release starts.

Cannot demodulate the Waverider signal from this distance, only hear it.

1614Z : Commence acoustic survey of mooring 789 position.

1732Z : Complete survey.

1831Z : Commence anchor drag tests.

26 January - Day 026

0122Z : Anchor drag test complete.

0208Z : Real Time Profiler in the water for test.

0407Z : RTP out of water. Made XBT profile No. 30 to check if RTP-identified hot patch (5°C) at 50 m was real. XBT did not confirm it.

0532Z : CTD No. 5 at mooring 789 (East Intermediate).

0815Z : CTD completed. Moving to 790 position (South Intermediate).

1017Z : CTD No. 6 at mooring 790.

1315Z : CTD completed.

1350Z : Commence anchor survey for mooring 790.

1507Z : Survey completed. Move to LOTUS-6 for RTP tests.

1645Z : RTP in water.

1736Z : LOTUS-6 2.48 n.mi. at 098T, by bridge radar.

1800Z : RTP ascending at about PCM profiling speed; PCM about 3 miles away and theoretically ascending at the same time.

2055Z : RTP aboard.

2130Z : Have just circled LOTUS-6. Commence shallow yo-yo CTD series (No. 7).

2225Z : CTD No. 7 yo-yo complete. Head west for more CTD work and another anchor drag test.

2351Z : Commence anchor drag test.

27 January - Day 027

0635Z : Anchor aboard; test complete.

0650Z : Commence CTD No. 8 at western point.

1000Z : CTD on board and secured. Move to northern station.

1142Z : CTD No. 9 at northern station.

1446Z : CTD secured in lab. Steaming south to get Waverider signals.

1612Z : Corer in water.

1836Z : Corer on board and secured; apparently empty. Return to LOTUS-6.

1945Z : Have finished visual examination of LOTUS-6 and the tethered Waverider buoy during 4 m peak-to-peak waves, 34 knots wind. All seems normal except twice, at 1911 and 1941 there was a sudden drop in the Waverider frequency followed by a marked increase. The low-high combination indicates (from Waverider manual) a possible strong rotation (yawing) of the buoy, inserting turbulence into the fluid around the accelerometer platform.

1949Z : Moving to try a second core.

1955Z : Commence coring.

2213Z : Corer aboard and secured; empty.

2251Z : Steam for Woods Hole.

28 January - Day 028

0000Z : Last 1736 Wavelogger record.

29 January - Day 029

1412Z : Dockside Woods Hole.

Figure A-2. Cruise track of OCEANUS cruise number 145.

16. Abstract (Limit: 200 words) OCEANUS cruises 141 (28 October - 4 November 1983) and 145 (22 - 29 January 1984) were the tenth and eleventh cruises to the Long Term Upper Ocean Study (LOTUS) area centered at 34°N, 70°W. During OCEANUS 141, a C. S. Draper Labs profiling current meter (PCM) was set, the fifth LOTUS surface mooring was recovered, and the deployment of the sixth LOTUS surface mooring was unsuccessfully attempted. The sixth surface mooring was finally deployed in January, on OCEANUS 145. This report provides details of the work accomplished on both cruises, as well as presenting the hydrographic data collected.					
17. Document Analysis a. Descriptors 1. LOTUS 2. Hydrographic data 3. Sargasso Sea b. Identifiers/Open-Ended Terms c. COSATI Field/Group
