## Abstract

Prochlorococcus, Synechococcus, and picoeukaryotic phytoplankton global observations with ancillary environmental data (nitrate, phosphate and temperature) from 1987 to 2008.

## Coverage

**Spatial Extent:** N:90 E:180 S:-90 W:-180

**Temporal Extent:** 1987 - 2008

---

## Dataset Description

Prochlorococcus, Synechococcus and picoeukaryotic phytoplankton global observations with ancillary environmental data (nitrate, phosphate and temperature) from 1987 to 2008.

## Acquisition Description

We compiled in situ observations with ancillary environment data of *Prochlorococcus*, *Synechococcus* and picoeukaryotic phytoplankton abundances in the global ocean.

For list of cruises and time series included please refer to Flombaum et al., 2013 Table S1 for *Prochlorococcus* and *Synechococcus*, and to Flombaum et al., in press Supplementary Table 1.

## Processing Description

BCO-DMO processing notes:

- Renamed fields to comply to database requirements

## Parameters

Parameter	Description	Units
Year	year (format:YYYY)	unitless
Day	Julian day	unitless
Latitude	Latitude, south is negative	decimal degrees
Longitude	Longitude, west is negative	decimal degrees
Nitrite_Nitrate	Sun of nitrite and nitrate concentration	Micromoles per Liter (umol/l)
Phosphate	Phosphate concentration	Micromoles per Liter (umol/l)
Temperature	Water temperature	Degrees Celcius ( ° C)
Depth	Water column depth	Meters (m)
Prochlorococcus	Cell abundance	Cells per milliliter (cells/ml)
Synechococcus	Cell abundance	Cells per milliliter (cells/ml)
Pico_eukaryotes	Picoeukaryotic phytoplankton cell abundance	Cells per milliliter (cells/ml)

## Project Information

### **Convergence: RAISE: Linking the adaptive dynamics of plankton with emergent global ocean biogeochemistry (Ocean\_Stoichiometry)**

NSF Award Abstract: Due to their sheer abundance and high activity, microorganisms have the potential to greatly influence how ecosystems are affected by changes in their environment. However, descriptions of microbial physiology and diversity are local and highly complex and thus rarely considered in Earth System Models. Thus, the researchers focus on a convergence research framework that can qualitatively and quantitatively integrate eco-evolutionary changes in microorganisms with global biogeochemistry. Here, the investigators will develop an approach that integrates the knowledge and tools of biologists, mathematicians, engineers, and geoscientists to understand the link between the ocean nutrient and carbon cycles. The integration of data and knowledge from diverse fields will provide a robust, biologically rich, and computationally efficient prediction for the variation in plankton resource requirements and

the biogeochemical implications, addressing a fundamental challenge in ocean science. In addition, the project can serve as a road map for many other research groups facing a similar lack of convergence between biology and geoscience. Traditionally, the cellular elemental ratios of Carbon, Nitrogen, and Phosphorus (C:N:P) of marine communities have been considered static at Redfield proportions but recent studies have demonstrated strong latitudinal variation. Such regional variation may have large - but poorly constrained - implications for marine biodiversity, biogeochemical functioning, and atmospheric carbon dioxide levels. As such, variations in ocean community C:N:P may represent an important biological feedback. Here, the investigators propose a convergence research framework integrating cellular and ecological processes controlling microbial resource allocations with an Earth System model. The approach combines culture experiments and omics measurements to provide a molecular understanding of cellular resource allocations. Using a mathematical framework of increasing complexity describing communicating, moving demes, the team will quantify the extent to which local mixing, environmental heterogeneity and evolution lead to systematic deviations in plankton resource allocations and C:N:P. Optimization tools from engineering science will be used to facilitate the quantitative integration of models and observations across a range of scales and complexity levels. Finally, global ocean modeling will enable understanding of how plankton resource use impacts Earth System processes. By integrating data and knowledge across fields, scales and complexity, the investigators will develop a robust link between variation in plankton C:N:P and global biogeochemical cycles.
