Abstract

Counts of larval fishes collected by a 1m2 Multiple Opening Closing Net and Environmental Sampling System (MOCNESS; MOC1) in a subtropical, pelagic environment from R/V F.G. Walton Smith cruise WS15161 in June 2015.

Dataset Description

Counts of larval fishes collected by a 1m² Multiple Opening Closing Net and Environmental Sampling System (MOCNESS; MOC1) in a subtropical, pelagic environment from R/V F.G. Walton Smith cruise WS15161 in June 2015.

Acquisition Description

Larval fishes were collected at each station using a Multiple Opening Closing Net and Environmental Sensing System (MOCNESS, <http://www.whoi.edu/instruments/viewInstrument.do?id=10008>) with a 1m² opening and 150µm mesh nets (MOC1). To capture larval fishes and mesozooplankton on a fine horizontal spatial scale, we sequentially fired each MOCNESS net every ~120-150m. Traveling at a speed of 2 m s⁻¹ each MOC1 net sampled ~120-150 m³. We fired a total of nine nets per tow. One net was open from the surface to depth (net zero), and eight nets sampled discrete depths. Net 0 was not enumerated for larval fish. Net 4 (or Net 5 in a few instances) did not have larval fish enumerated, as sample was collected for a collaborator. At every station, this fine-scale net sampling was repeated at 15m and 30m depth (randomized order). Once onboard, the nets were rinsed with seawater and the contents of each cod end immediately preserved in 95% ethanol. All larval fishes were separated out of the samples, enumerated, and stored for later SL measurements.

Processing Description

BCO-DMO data manager processing notes:

Version 1 (2017-08-23):

- Originally submitted Excel file exported as csv
- Changed parameter names to BCO-DMO standards by using same param names as MOC4 dataset (OSTRICH)
- Added a cruise_id column consistent with other datasets in project
- Formatted tow_vol to 1 decimal place
- Added lat_start, lon_start, lat_end, lon_end columns
- Removed comment for Stn 10W net 1 "net did not sample properly" and replaced with "nd"

Version 2 (2020-03-31) replaces version 1 (2017-08-23)

* ISO_DateTime_start_UTC column added from the date and time_start columns which were in EDT (UTC-4).

* Parameter descriptions removed for columns not in the data (tow_description, day_or_night, location)

Parameters

Parameter	Description	Units
study	Study type: Spatial, Lagrangian, or Eddy	unitless
cruise_name	Cruise name	unitless
cruise_id	Official cruise identifier	unitless
station	Station identifier	unitless
tow_type	Tow type: S = shallow, M = middle, D = deep	unitless
net	MOC1 tow net number	unitless
date	Date of tow (EDT) in m/d/yyyy format	unitless
time_open	Time (24h) net opened (EDT) in hh:mm format	unitless
time_closed	Time (24h) net closed (EDT) in hh:mm format	unitless
depth_open	Depth net opened	meters (m)
depth_close	Depth net closed	meters (m)
tow_vol	Volume of water towed by net; "nd" if volume was not recorded.	cubic meters (m ³)
larval_fish_count	Number of larval fish in net	unitless
lat_start	Latitude when net tow started	decimal degrees
lon_start	Longitude when net tow started	decimal degrees
lat_end	Latitude when net tow ended	decimal degrees
lon_end	Longitude when net tow ended	decimal degrees
ISO_DateTime_start.UTC	Timestamp when net opened (time zone UTC) in ISO 8601 format yyyy-mm-ddTHH:MMZ	unitless

Instruments

Dataset-specific Instrument Name	MOC1; MOCNESS1
Generic Instrument Name	MOCNESS1
Dataset-specific Description	Multiple Opening Closing Net and Environmental Sensing System with a 1m2 opening and 150um mesh nets (MOC1). http://www.whoi.edu/instruments/viewInstrument.do?id=10008
Generic Instrument Description	The Multiple Opening/Closing Net and Environmental Sensing System or MOCNESS is a family of net systems based on the Tucker Trawl principle. The MOCNESS-1 carries nine 1-m2 nets usually of 335 micrometer mesh and is intended for use with the macrozooplankton. All nets are black to reduce contrast with the background. A motor/toggle release assembly is mounted on the top portion of the frame and stainless steel cables with swaged fittings are used to attach the net bar to the toggle release. A stepping motor in a pressure compensated case filled with oil turns the escapement crankshaft of the toggle release which sequentially releases the nets to an open then closed position on command from the surface. -- from the MOCNESS Operations Manual (1999 + 2003).

Project Information

Spatial variability of larval fish in relation to their prey and predator fields: Patterns and interactions from cm to 10s of km in a subtropical, pelagic environment (OSTRICH)

Coverage: Straits of Florida, Western Atlantic

Description from NSF award abstract: The spatial pattern of organisms within pelagic marine environments is of significant ecological importance, and this is particularly true for larval fishes. Patchy prey and predator environments should lead to variation in predator-prey interactions, and thus to variations in larval fish growth and survival. These have proven very difficult to resolve in nature, due in large part to the broad range of spatial scales involved and technological challenges with adequately sampling the various processes simultaneously. This study will use new technology (In Situ Ichthyoplankton Imaging System - ISIS) to simultaneously measure the fine-scale distribution of larval fishes in relation to their prey, their planktonic predators, and the physical environment of the Straits of Florida. This will be combined with targeted fine-scale net sampling and analyses of individual recent daily larval growth. By sampling a series of water masses at very high resolution, this study will address specific hypotheses concerning: i) the drivers of aggregations and patchiness, and ii) the biological consequences of predator-prey interactions at fine scales. The primary intellectual merit of the study is the unprecedented examination of plankton processes at scales of relevance to biological interactions among larval fishes, their prey, and their predators. This field study will further our understanding of the predator-prey interactions contributing to spatially explicit larval growth and mortality patterns. The focus on subtropical planktonic food webs will enhance scientific knowledge of these understudied pelagic ecosystems and provide valuable data for comparative analyses with pelagic food web dynamics at higher latitudes. A deeper understanding of pelagic planktonic ecosystems over a range of spatial and temporal scales is increasingly important as the oceans undergo major environmental changes. Substantial increases in the relative dominance of gelatinous organisms, for example, have the potential to cause major shifts in pelagic food webs. A better understanding of the fine-scale interactions of such food webs will help society anticipate and respond to the consequences of such changes. Note (07 Oct 2014): Funding for this project transferred from award OCE-1333800 to OCE-1419987, coincident with the Principal Investigator's affiliation change from University of Miami to Oregon State University.
