Figure A4
Inversion models without the TE mode apparent resistivity. Inversion settings such as smoothing parameter and model mesh are the same as those for Figure 6c. The upper figure is a model using all available data for 2-D inversion listed in Table 1 (this is the same figure as Figure 6c), the middle figure is the model without two sites data (site number 10 and 20), and the lower figure is a ratio of the two models. A total RMS misfit of the upper model is 1.122 and that of the middle model is 1.128.
