B. Rogers	Zooplankton

Report prepared by

J. H. Ryther and D. W. Menzel
Woods Hole Oceanographic Institution
Woods Hole, Massachusetts, U. S. A.

Cruise Description

En route from the U. S. to Bombay, India during February - March, 1963 an unscheduled oceanographic section of 13 stations was made in the Arabian Sea between Aden and Bombay. Standard hydrographic casts were made to 1400 meters indicated depth (1000 meters at Stations 1-3) for measurement of temperature, salinity, dissolved oxygen, phosphate, nitrite, nitrate and silicate. A large, plastic sampler was used to obtain water samples from depths corresponding to 100, 50, 25, 10 and 1% of the sunlight incident to the surface. These samples were used for measurement of primary productivity (C-14 method), phytoplankton pigments, particulate carbon, nitrogen and phosphorus.

Productivity measurements were made for 24 hours at natural, in situ light intensities, using an on-deck incubator with neutral density screens to simulate the light at each depth sampled. Duplicate samples were exposed to fluorescent illumination at a constant intensity of 1000 foot candles for 4 hours.

Standard vertical net tows were made from 200 meters to the surface with an IIOE standard net (one-meter² mouth, 0.33 mm mesh opening). The displacement volume of each sample was measured. The samples will be deposited in the International Biological Centre, Cochin, India.

Vertical plankton tows were also made from 200 meters to the surface with a 1/2 m² mouth, 0.64 mm mesh opening truncated net for microplankton samples.

Oblique tows were made with a series of pressure-operated opening-closing plankton nets designed by Dr. Allan W. H. Bé (Lamont Geological Observatory). Nets were 3/4 m², 0.33 mm mesh opening. Depth intervals sampled (depth permitting) were 0-100, 100-250, 250-500, 500-1000 and 1000-2000 meters.

The fine-mesh net samples and Bé net samples will be deposited at the U. S. Sorting Center, U. S. National Museum, Smithsonian Institution, Washington, D. C.

Methods used for physical, chemical, productivity and pigment measurements are described in detail in a publication entitled "Instruction Manual for Routine Measurements for the U. S. Program in Biology, IIOE" prepared by David W. Menzel and is available at the Woods Hole Oceanographic Institution.

Bathythermograph observations were made at each station and at hourly intervals between stations. Bathymetry was recorded continuously with a precision echo sounder manufactured by Alpine Geophysical Associates, Norwood, New Jersey.

All analyses were completed and reduced data sheets prepared at sea. These data will be deposited at the U. S. National Oceanographic Data Center after they have been rechecked against original log sheets and work books. In the interest of those who will be working in the Arabian Sea before these data are available from NODC, this report containing preliminary results has been prepared.
