Figure S2. Average annual cycles in phytoplankton carbon for the 14 subarctic Atlantic bins. Satellite-based annual cycles of (open symbols) depth-integrated carbon ($\Sigma C_{\text{phyto}}$) and (closed symbols) surface phytoplankton carbon concentration ([C$_{\text{phyto}}$]). Panels are spatially arranged to correspond to the distribution of bins in figure 1a of the main manuscript. $\Sigma C_{\text{phyto}}$ is scaled to plot with surface concentration. Dashed vertical blue line = winter solstice. Dashed vertical green line = maximum MLD.
